Spec. British Patent, 5, 530, April, 1899. the armature winding when the motor is started and replaced by the first mentioned winding when synchronism is attained. A general idea of the British T. II. Patent referred to, may be obtained by an inspection of Figure 72. This patent has to do with improvements in self-starting devices, by the introduction of certain combinations of inductance and condensance, or-of resistance and reactance in parallel with the motor across the mains. Fig. 72. Alexander Heyland has devised a form of single-phase selfstarting motor. In this machine the chief winding is distributed in a set of slots, the leakage self-induction being reduced by having separate teeth over a considerable part of the periphery. The starting winding consists of closed coils wound in a bunched fashion so as to increase the leakage self-induction. A thin section of iron also bridges the slots holding these conductors. The currents induced in this closed winding, lag greatly and produce a cross field similar to another phase winding. His more recent work⁷ on the polyphase motor may have also some bearing upon single-phase work. oElec. Eng. , Sept. , 1897. Another interesting type of single-phase motor designed a short time ago by Prof. D. C. Jackson, consists of a rotor with two separate windings, one a commutated winding having resistance connectors joining successive segments of the commutator to avoid sparking, and the other, a winding short circuited...
